Trojan Invasion

Trojan army marches upon Sparta. Vicious waves of Trojan warriors are getting ready to attack the Spartan defense and make their way into the city.

First, you will be given a **number** equal to the **waves of Trojan warriors**. On the **second** line you will be given the **plates of the Spartan defense**. Then, on each next line (**for each wave**), you receive the power of **each Trojan warrior**. Additionally, on every **third wave**, the Spartans build a **new plate** (**extra** line with a single integer) **before** the Trojan warriors attack. In order to enter the city, the Trojans have to **destroy all the plates**.

Until there are **no more plates** or **warriors**, the **last Trojan warrior** attacks **the first plate**:

- If the **warrior's** value is **greater**, he **destroys** the plate and **lowers** his value by the plate's value, then attacks the **next** plate, **until** his value reaches 0.
- If the **plate's** value is **greater**, the warrior **dies** and the plate **decreases** its value by the warrior's value.
- If their values are **equal**, the warrior **dies** and the plate is **destroyed**.

Input

- **First** line: integer- the number of **waves**
- **Second** line: integers, representing the **plates**, **separated by a single space**.
- For each **wave:** integers, representing the **warriors**, **separated by a single space**.
    - On every **third** wave, you will be given an **extra line** with a **single** integer, which will be the **plate you need to add**. **[!]** Add the plate **before** processing the attacks. **[!]**

Output

- On the first line of output – print if the Trojans destroyed the Spartan defense:
    - True: "**The Trojans successfully destroyed the Spartan defense.**"
    - False: "**The Spartans successfully repulsed the Trojan attack.**"
- On the second line - print all plates or warriors left, separated by comma and a white space:
    - If there are warriors: "**Warriors left: {warrior1}, {warrior2}, {warrior3}, (…)**"
    - If there are plates: "**Plates left: {plate1}, {plate2}, {plate3}, (…)**"

Constraints

- All of the given numbers will be valid integers in the range [1, 100].
- **Not all waves** may be needed to destroy the defense.
- There will **always** be a **winning side**, meaning either no warriors or plates left.

Examples

Input	Output	Comment

3
10 20 30
4 5 1
10 5 5
10 10 10
4
	The Spartans successfully repulsed the Trojan attack.
	Plates left: 4
		• First wave (4 5 1):
		  ○ Warrior (1) attacks Plate (10) => dies and plate is now 9.
		  ○ Warrior (5) attacks Plate (9) => dies and plate is now 4.
		  ○ Warrior (4) attacks Plater (4) => dies and plate is gone.
		• Second wave (10 5 5):
		  ○ Warrior (5) attacks Plate (20) => dies and plate is now 15.
		  ○ Warrior (5) attacks Plate (15) => dies and plate is now 10.
		  ○ Warrior (10) attacks Plate (10) => dies and plate is gone.
		• Third wave (10 10 10):
		  ○ Spartans build a new plate (4), plates are now: 30 4
		  ○ Warrior (10) attacks Plate (30) => dies and plate is now 20.
		  ○ Warrior (10) attacks Plate (20) => dies and plate is now 10.
		  ○ Warrior (10) attacks Plate (10) => dies and plate is gone.
		• We have no more waves and one plate left (4) => see the output.

5
10 30 10
3 3 4
10 10 10
5 5
5
7 6
8 6 7
	The Trojans successfully destroyed the Spartan defense.
	Warriors left: 1, 7
		• First wave (3 3 4):
		  ○ Warrior (4) attacks Plate (10) => dies and plate is now 6.
		  ○ Warrior (3) attacks Plate (6) => dies and plate is now 3.
		  ○ Warrior (3) attacks Plater (3) => dies and plate is gone.
		• Second wave (10 10 10):
		  ○ Warrior (10) attacks Plate (30) => dies and plate is now 20.
		  ○ Warrior (10) attacks Plate (20) => dies and plate is now 10.
		  ○ Warrior (10) attacks Plate (10) => dies and plate is gone.
		• Third wave (5 5):
		  ○ Spartans build a new plate (5), plates are now: 10 5
		  ○ Warrior (5) attacks Plate (10) => dies and plate is now 5.
		  ○ Warrior (5) attacks Plate (5) => dies and plate is gone.
		• Fourth wave (7 6):
		  ○ Warrior (6) attacks Plate (5) => the warrior is now 1 and the plate is gone.
		• We have no more plates, so the waves stop coming => see the output. Also, we stop the input. (8 6 7 is not proceeded, but is in the input because the waves are 5)
